

ABSTRACT

A siding system which employs a plurality of siding assemblies, each capable of being selectively attached to other siding assemblies in a series. Each siding assembly has a wall bracket for selective attachment to a support structure such as a wall, and an associated siding panel. Each wall bracket is selectively attachable to its own associated siding panel and to the next higher siding panel of the series. When damaged, the individual siding panels are easily detached from the wall brackets and quickly replaced with an undamaged panel.
